

Mateo Pineda

Agentic Engineer

github.com/euxaristia | euxaristia.github.io

PROFILE

Agentic engineer who leverages AI tools to ship real, non-trivial contributions to production codebases. Contributor to open-source projects maintained by Google, Qwen (Alibaba), and others, with accepted PRs spanning CLI tooling, security fixes, and core runtime behavior. Builds personal systems projects -- including a C compiler, a POSIX-compatible shell, and a Make alternative -- using AI-assisted development to move fast and iterate on complex domains.

OPEN SOURCE CONTRIBUTIONS (MERGED)

All contributions below are merged into upstream repositories. Trivial changes (typo fixes, documentation-only updates, and link corrections) are excluded.

google-gemini/gemini-cli -- Google's official CLI for Gemini models

- â € Text sanitization data loss fix (PR #22624) -- Resolved a bug where C1 control characters caused silent data loss during text sanitization, corrupting CLI output. Labeled area/core, help wanted.
- â € Detached mode child process fix (PR #22620) -- Disabled detached mode in Bun runtime to prevent child processes from receiving immediate SIGHUP on spawn. Labeled area/core, area/platform, help wanted.
- â € AbortError log suppression (PR #22621) -- Suppressed unhandled AbortError logs that appeared during normal request cancellation. Labeled area/core, help wanted.

QwenLM/qwen-code -- Qwen Code Agent (Alibaba)

- â € Loop detection and stagnation checks (PR #3236) -- Implemented enhanced agent loop detection with read-file, action-stagnation, and repetitive-thought checks, injecting stop directives to break infinite retry cycles.
- â € Tool validation retry loop fix (PR #3178) -- Prevented the model from entering infinite retry loops when a tool call repeatedly failed schema validation with the same error.
- â € Shell output overflow fix (PR #2857) -- Constrained shell output width to prevent wide table output from overflowing the TUI bordered box container.
- â € Input lag fix from quote-based drag detection (PR #2837) -- Removed quote-based drag-and-drop detection that caused significant input lag when typing single or double quote characters.

Gitlabw/openclaude -- Open-source Claude implementation

- â € SSRF bypass fix in custom search provider (PR #610) -- Closed multiple SSRF bypass vectors in the custom provider hostname guard that allowed requests to resolve to private/reserved IPs through literal-address forms.
- â € Abort listener memory leak fix (PR #611) -- Fixed a memory leak where fetchWithRetry attached a fresh abort listener to the AbortSignal on every retry attempt without ever removing them.

clockworklabs/SpacetimeDB -- Distributed relational database

- â € Version uninstall validation fix (PR #4774) -- Prevented the CLI from showing a confirmation prompt for uninstalling versions that were not actually installed, which previously resulted in a cryptic OS-level error.

posva/cating -- Popular terminal image renderer (C, ~2.7k stars)

- â € stb_image upgrade and MJPEG/YUYV decoding fix (PR #78) -- Upgraded stb_image to v2.30 and improved MJPEG (AVI1) and raw YUYV decoding support.

PERSONAL PROJECTS

meowsh -- POSIX-compatible shell implementation (Rust)

- â € Implemented function-local variable scoping with snapshot/restore semantics.
- â € Built zsh compatibility layer enabling .zshrc parsing and oh-my-zsh skeleton execution.
- â € Added indexed arrays, variable substitution references (\${var/old/new}), and compsys stubs.

pcc -- C compiler (TypeScript, porting to C)

- â € Implemented a complete recursive descent C parser in C (~450 lines replacing 633 lines of TypeScript).
- â € Ported the lexer to C with full operator tokenization and test coverage.

â ¢ Fixed preprocessor to recursively process directives in included files.

â ¢ Achieved 67/67 tests passing across parser and semantic analyzer.

mkultra -- POSIX Make alternative (Pony)

â ¢ Rewrote from Rust to Pony with stdlib-only dependencies and parallel job execution (-j N).

â ¢ Implemented POSIX recipe prefixes (-, +, -), expansion (\${VAR}, substitution refs), and command-line macro overrides.

VoxelPopuli -- Voxel engine with OpenGL (Rust)

â ¢ Fixed cloud transparency rendering over water when viewed from above (depth mask compositing).

colt -- Terminal text editor (Rust)

â ¢ Fixed SHIFT+G normal-mode command to correctly navigate to bottom of file (vim behavior).

APPROACH

All projects and contributions are AI-assisted. I use large language models as force multipliers -- not to replace understanding, but to accelerate iteration on complex systems. This means I can contribute meaningfully across languages and domains I would not reach working alone: C compilers, POSIX shell semantics, runtime process management, and security-sensitive networking code.
