

Pull Request Overview

Comprehensive analysis of open pull requests across personal repositories
and upstream open-source contributions.

User: euxaristia · **Org:** Cairn

Date: 2026-05-12 · **Open PRs:** 19

Pull Request Status Report

GitHub: [euxaristia](#) / Cairn Organization

This report provides a comprehensive overview of all open pull requests associated with the GitHub user **euxaristia** across personal repositories and upstream contributions, as well as any open pull requests within the **Cairn** organization. The data was collected on **2026-05-12** (ISO 8601) using the GitHub public API. The report is designed to help track contribution velocity, identify stale PRs that may need follow-up, and highlight key areas of active development work.

Metric	Count
Open PRs authored by euxaristia	19
Open PRs in Cairn organization	0
PRs involving euxaristia (non-author)	2
Total personal repositories	59
Cairn organization repositories	1

Table 1: Summary of pull request metrics for euxaristia and Cairn

Open Pull Requests Detail

The following table lists all 19 open pull requests authored by euxaristia, sorted by creation date in descending order. These span personal repositories, forks, and upstream contributions to major open-source projects. Each entry includes the repository, PR number, a descriptive title, and the date the PR was created. All dates conform to ISO 8601 (YYYY-MM-DD).

Repository	PR	Title	Created
gemini-cli (fork)	#4	fix(build): detect Bun runtime in build scripts	2026-05-12
gemini-cli (fork)	#3	fix(core): make shell tool work under Bun	2026-05-12
gitee-cli	#2	feat: implicitly use current repo and branch context for pr commands	2026-05-09
colt	#5	fix(editor): typing/pasting "(" now actually inserts the character	2026-05-09
colt	#4	feat: mouse click moves cursor; drag enters Visual mode	2026-05-07

Repository	PR	Title	Created
google-gemini/gemini-cli	#26498	feat(cli): show acknowledgment when user steering hint is processed	2026-05-05
anomalyco/opencode	#25355	fix(tui): bind home/end to line start/end in input	2026-05-01
google-gemini/gemini-cli	#26280	fix(build): detect Bun runtime in build scripts	2026-04-30
VoxelPopuli	#4	Parallelize chunk generation across rayon worker pool	2026-04-28
colt	#3	fix: prevent status bar from wrapping when narrower than its content	2026-04-28
charmbracelet/gh	#937	fix: ensure closing fence in WrapCodeBlock is on its own line	2026-04-26
VoxelPopuli	#2	chore(deps): replace image and rayon with smaller alternatives	2026-04-22
colt	#1	feat(substitute): add regex support to ":s/" command	2026-04-14
tree-sitter	#1	feat(runtime): pure-Rust runtime crate; port point.c	2026-04-14
dotfiles	#1	feat: add protected-branch check to git safety rules	2026-04-13
clockworklabs/SpacetimeDB	#4773	feat(bindings-cpp-ffi): add Rust FFI crate for WASM modules	2026-04-10
QwenLM/qwen-code	#2838	feat: add bun runtime support	2026-04-02
google-gemini/gemini-cli	#22618	fix(cli): respect ui.loadingPhrases "off" setting	2026-03-16
microsoft/node-pty	#901	fix: swallow resize() errors after PTY exit on Windows and Unix	2026-03-13

Table 2: All open pull requests authored by euxaristia, sorted by date (newest first)

Staleness Analysis

Understanding the age of open pull requests is critical for prioritizing follow-up actions. The table below categorizes each PR by age bracket as of the report generation date (2026-05-12). PRs older than 30 days are flagged as potentially stale, as they may have accumulated merge conflicts or lost reviewer context. Proactive rebasing and polite follow-up comments on these older contributions can significantly improve merge velocity.

Age Bracket	Count	Repositories
0-7 days	6	gemini-cli, gitee-cli, colt, opencode

8-30 days	8	colt, VoxelPopuli, glow, tree-sitter, dotfiles, SpacetimeDB, qwen-code
31-60 days (stale)	5	gemini-cli, qwen-code, node-pty

Table 3: PR age distribution as of 2026-05-12

PRs Involving euxaristia (Non-Author)

In addition to the 19 PRs directly authored by euxaristia, two additional pull requests involve euxaristia as a commenter, reviewer, or referenced contributor. These PRs are listed below and may represent collaborative work, review requests, or issues where euxaristia provided input that shaped the direction of the contribution.

Repository	PR	Title
BingqingLyu/qwen-code	#73	feat: add bun runtime support
this-is-dev/InnerDemons	#9	y cant i merge?

Table 4: PRs involving euxaristia as a non-author contributor

Cairn Organization Status

The Cairn organization currently maintains a single repository: **floriography**, a TypeScript project described as providing a random flower, its Latin name, and a verse from a real English poem. As of **2026-05-12**, there are no open pull requests across the Cairn organization. This means that all previous contributions have been merged, closed, or the project is in a stable state with no pending changes requiring review. Given that the repository appears to be a small, focused project, this is consistent with expected activity levels.

Key Themes and Analysis

Examining the distribution of open pull requests reveals several clear patterns in the types of work euxaristia is actively pursuing. These themes highlight both technical interests and the breadth of the open-source communities in which euxaristia participates.

Bun Runtime Compatibility

A significant cluster of PRs focuses on adding or improving Bun runtime support across multiple projects. This includes PR #4 and #3 on the `gemini-cli` fork (created 2026-05-12), PR #26280 on `google-gemini/gemini-cli` (2026-04-30), and PR #2838 on `QwenLM/qwen-code` (2026-04-02). This pattern suggests a strong interest in the Bun JavaScript runtime as an alternative to Node.js, with a focus on ensuring that build scripts, CLI tools, and shell integrations work correctly when executed under Bun rather than Node. The recurrence of this theme across independent projects indicates that Bun compatibility is an area where euxaristia has developed specialized expertise, and these contributions may serve as reference implementations for other projects encountering similar issues.

colt Editor Development

The **colt** repository, a vi-style editor written in the Pony programming language, has four open PRs (#1 through #5) representing active and ongoing feature development. The work spans foundational editing features such as regex substitution support in the `":s/"` command (PR #1, 2026-04-14), visual mode improvements with mouse click and drag support (PR #4, 2026-05-07), character input fixes for parentheses insertion (PR #5, 2026-05-09), and status bar layout corrections (PR #3, 2026-04-28). This concentration of PRs in a single repository signals that colt is the primary personal project receiving active development attention, and the breadth of features being implemented suggests a goal of making the editor increasingly usable for daily text editing workflows.

Upstream Open-Source Contributions

Several PRs target well-known upstream repositories, including `google-gemini/gemini-cli`, `microsoft/node-pty`, `charmbracelet/gh`, `anomalyco/opencode`, `clockworklabs/SpacetimeDB`, and `QwenLM/qwen-code`. These contributions demonstrate engagement with the broader open-source ecosystem beyond personal projects. Notably, the PRs to `microsoft/node-pty` (#901, 2026-03-13, PTY resize error handling) and `charmbracelet/gh` (#937, 2026-04-26, markdown rendering fix) address fundamental cross-platform issues that benefit a wide user base. The diversity of target projects, spanning CLI tools, terminal emulators, AI coding assistants, and database systems, reflects broad technical fluency and a willingness to contribute fixes and features wherever problems are identified.

Systems-Level Rust Development

Three PRs involve Rust-focused systems work: the `tree-sitter` pure-Rust runtime (PR #1, 2026-04-14), `VoxelPopuli` chunk parallelization with `rayon` (PR #2, 2026-04-22 and PR #4, 2026-04-28), and `SpacetimeDB` FFI bindings for WASM modules (PR #4773, 2026-04-10). These contributions target low-level, performance-critical domains including parser runtimes, voxel engine optimization, and WebAssembly module interop. The `tree-sitter` contribution is particularly ambitious, involving a complete rewrite of the runtime in pure Rust, which would eliminate the C dependency and make

tree-sitter more accessible to the Rust ecosystem. This theme underscores a strong systems programming orientation alongside the higher-level CLI and web tool contributions.

Recommendations

Based on the current state of open pull requests, the following actions may help improve contribution effectiveness and ensure that ongoing work receives timely attention from maintainers.

1. Prioritize stale PRs: The oldest open PR (microsoft/node-pty #901, created 2026-03-13) has been open for approximately 60 days. Consider following up with maintainers through a polite comment or by rebasing the branch onto the latest main to resolve any merge conflicts that may have accumulated. PRs on google-gemini/gemini-cli (#22618, 2026-03-16) and QwenLM/qwen-code (#2838, 2026-04-02) are also in the stale bracket and may benefit from similar follow-up actions.

2. Consolidate gemini-cli contributions: Three separate PRs target the google-gemini/gemini-cli repository. If these changes are related (e.g., the Bun build detection fix appears in both PR #4 on the fork and PR #26280 upstream), consider consolidating them into a single, well-organized PR to reduce reviewer overhead and improve the chances of timely merge.

3. Continue colt editor momentum: The colt editor has the most active development pipeline with four open PRs. Maintaining a regular merge cadence for these features will prevent the PR stack from growing unmanageably and will allow incremental user feedback on each new capability.
